Mindset testing:

1) Gratitude page to write entries, mobile adaption

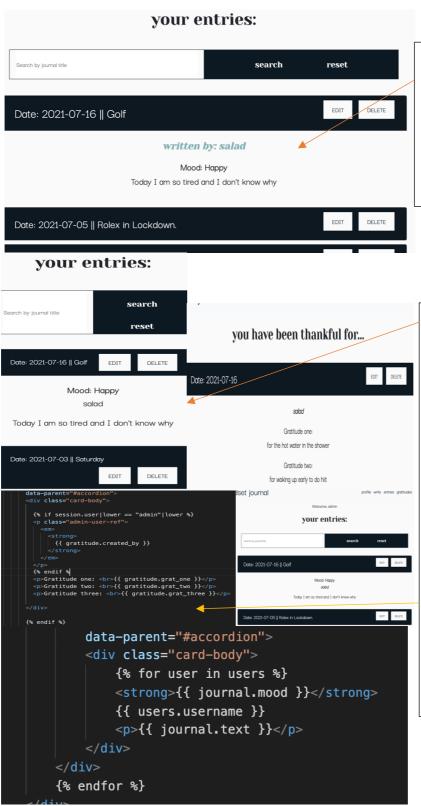

Some design issues occurred for the Gratitude.html page in the mobile view. Originally the painting image was its own in a column but it was not collapsing correctly. To remedy this and to improve the page visually, I kept the form as a column to take up half the page on desktop and entire page in mobile view and made the painting a background image to cover the row as there would be too much dead space otherwise.

gratitudes

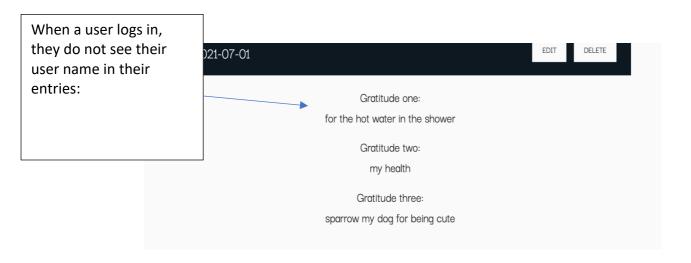

2) Ensuring therapist has access to client entries, but to distinguish who wrote the entry. I added jinja to loop through both entry_collection.html and gratitude_collection.html to show {{ journal.created_by }} when the admin (therapist is logged in.

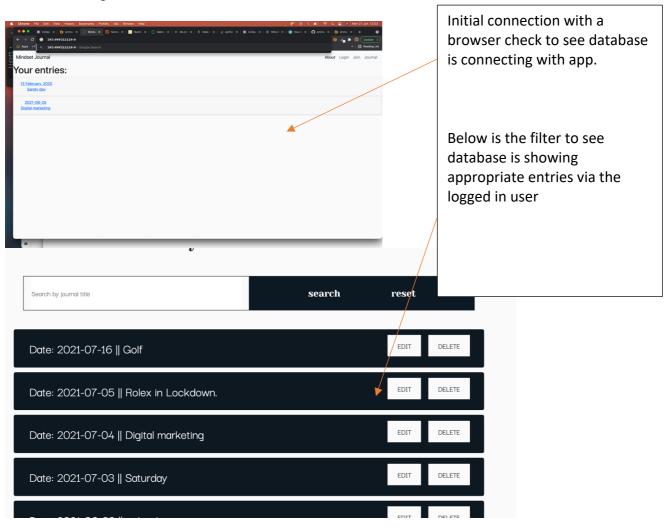

FINAL Result, admin will see entry username for each gratitude and journal entry which is highlighted in the grey-blue as before, the italics did not bring a strong enough contrast.

Here are the tests for journal entries and gratitude entries when logged in as 'admin' to see that I can see the users that created the entry to be more useful for a therapist.

The code to do so, using JINJA to isolate only the admin's accessibility to provide privacy to users' entries to other users but also a user doesn't need to see their name when they create their entry

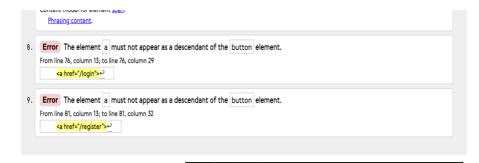

3) Testing MONGODB and Flask initial connection:

4) HTML Tests:

Results from the HTML validator. I fixed the minor issues. There is one where it says an anchor cannot be within the button on the homepage. I altered it to make it have a 'onclick' function instead but the editor in gitpod still called it an error even though it was then considered fixed.

```
| Section | Continue |
```

This is the correct method I applied with the onclick function but as you can see, the IDE was not happy about it.

| Interpretation | Content | Content

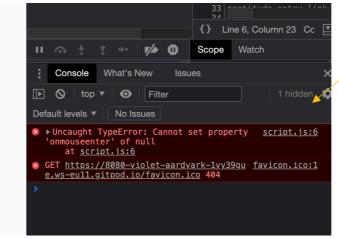

Some issues related to the preset Bootstrap settings so I didn't change them.

Original code and the code I reverted back to.

5) CSS: There were some minor errors in CSS, I forgot a p in px in some box-shadow stylings which I corrected.

6) Javascript, I used JSHint to check my Javascript. I corrected missing semi-colons, defined logBtn and regBtn. The second half I left as it was because I was getting on error on Chrome DevTools after the 'correction':

Chrome devtool error

```
// To start, simply enter some JavaScript anywhere on this page. Your // report will appear on the right side.

// report will appear on the right side.

// remover and diditionally, you can toggle specific options in the Configure

// menu.

function jouPro()

document_getElementById("proJournalEntry").innerHTML = "see whatdpryou wrote."

function jouPro()

largest functions in this file.

Function with the largest signature take 0 arguments, while the median is 0.

largest function has 2 statements in it, while the median is 1.

Shift function jouPro()

function jouPro()

// report will appear on the right side.

Function with the largest signature take 0 arguments, while the median is 0.

largest function has 2 statements in it, while the median is 1.

Shift function jouPro()

function jouPro()

In most complex function has 2 statements in it, while the median is 1.

One warning

19 Unnecessary semicolon.

One undefined variable

13 original

18 original

Two unused variables

12 jouPro

17 jouOr
```

- 7) I have tried my app on to check the responsive behaviour and appearance:
- Macbook Pro
- Large PC
- iPhone
- iPad
- Lenovo Laptop
- Dell Laptop
- Android phone
